            <key>description</key>
            <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de

            <key>description</key>
            <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be

```

consistent with the emerging Unicode standard, and would permit universal representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

<key>description</key>

<string>Arie de Ruiter, who in 1995 was Head of Information Technology Development at Elsevier Science, made a proposal to the STI Pub group, an informal group of publishers consisting of representatives from the American Chemical Society (ACS), American Institute of Physics (AIP),

American Mathematical Society (AMS), American Physical Society (APS), Elsevier, and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter encouraged the members to consider development of a series of Web fonts, which he proposed should be called the Scientific and Technical Information eXchange, or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this proposal, and the STI Pub group agreed to embark on what has become a twelve-year project. The goal of the project was to identify all alphabetic, symbolic, and other special characters used in any facet of scientific publishing and to create a set of Unicode-based fonts that would be distributed free to every scientist, student, and other interested party worldwide. The fonts would be consistent with the emerging Unicode standard, and would permit universal representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

            <key>description</key>
            <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

            <key>description</key>
            <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every

```

scientist, student, and other interested party worldwide. The fonts would be consistent with the emerging Unicode standard, and would permit universal representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

        <key>description</key>
        <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

      <string>PT Mono -- is a monospaced font of
the PT Project series. First families PT Sans and PT Serif were released in 2009
and 2010. PT Mono was developed for the special needs -- for use in forms,
tables, work sheets etc. Equal widths of characters are very helpful in setting
complex documents, with such font you may easily calculate size of entry fields,
column widths in tables and so on. One of the most important area of use is web
sites of "electronic governments" where visitors have to fill different request
forms. Designer Alexandra Korolkova with a participation of Bella Chaeva.
Released by ParaType in 2011.</string>

            <string>Adrian Frutiger designed Avenir in
1988, after years of having an interest in sans serif typefaces. In an interview
with Linotype, he said he felt an obligation to design a linear sans in the
tradition of Erbar and Futura, but to also make use of the experience and
stylistic developments of the twentieth century. The word Avenir means 'future'
in French and hints that the typeface owes some of its interpretation to Futura.
But unlike Futura, Avenir is not purely geometric; it has vertical strokes that
are thicker than the horizontals, an "o" that is not a perfect circle, and
shortened ascenders. These nuances aid in legibility and give Avenir a
harmonious and sensible appearance for both texts and headlines. In 2004 Adrian
Frutiger and the type director of Linotype GmbH Akira Kobayashi reworked the
Avenir and created the Avenir Next for the Platinum Collection.</string>

<key>description</key>

<string>Adrian Frutiger designed Avenir in 1988, after years of having an interest in sans serif typefaces. In an interview with Linotype, he said he felt an obligation to design a linear sans in the tradition of Erbar and Futura, but to also make use of the experience and stylistic developments of the twentieth century. The word Avenir means 'future' in French and hints that the typeface owes some of its interpretation to Futura. But unlike Futura, Avenir is not purely geometric; it has vertical strokes that are thicker than the horizontals, an "o" that is not a perfect circle, and shortened ascenders. These nuances aid in legibility and give Avenir a harmonious and sensible appearance for both texts and headlines. In 2004 Adrian Frutiger and the type director of Linotype GmbH Akira Kobayashi reworked the

Avenir and created the Avenir Next for the Platinum Collection. </string>

        <key>description</key>
        <string>Designed in 1997 as a collaborative
work between Microsoft's Vincent Connare and top Monotype designers Sue
Lightfoot, Ian Patterson and Geraldine Wade. The images are intended for web
designers who wish to include live fonts as a fast way of rendering graphics.

```

Webdings is the latest member of Microsoft's Webfonts. Design coordination by Vincent Connare. Image designs by Vincent Connare, Ian Patterson, Sue Lightfoot and Geraldine Wade. Web and design consultation by Simon Daniels. TrueType hinting by Vincent Connare. Completed April 29, 1997.</string>

<key>description</key>
<string>PT Serif is a universal type family
designed for use together with PT Sans released earlier. PT Serif coordinates
with PT Sans on metrics, proportions, weights and design. It consists of six
styles: regular and bold weights with corresponding italics form a standard
computer font family; two caption styles (regular and italic) are for texts of
```

small point sizes. The letterforms are distinguished by large x-height, modest stroke contrast, robust wedge-like serifs, and triangular terminals. Due to these features the face can be qualified as matched to modern trends of type design and of enhanced legibility. Mentioned characteristics beside conventional use in business applications and printed stuff make the fonts quite useable for advertising and display typography.

Each font next to standard Latin and Cyrillic character sets contains alphabet glyphs of title languages of the national republics of Russian Federation and support the most of the languages of neighboring countries. The fonts were developed and released by ParaType in 2010 with financial support from Federal Agency of Print and Mass Communications of Russian Federation. Design -- Alexandra Korolkova with assistance of Olga Umpeleva and supervision of Vladimir Yefimov.</string>

            <key>description</key>
            <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

    <key>description</key>
    <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

                <string>Monotype Drawing Office 1982. A

```

contemporary sans serif design, Arial contains more humanist characteristics than many of its predecessors and as such is more in tune with the mood of the last decades of the twentieth century. The overall treatment of curves is softer and fuller than in most industrial-style sans serif faces. Terminal strokes are cut on the diagonal which helps to give the face a less mechanical appearance. Arial is an extremely versatile family of typefaces which can be used with equal success for text setting in reports, presentations, magazines etc, and for display use in newspapers, advertising and promotions.</string>

      <key>description</key>
      <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

```
    <key>description</key>
    <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

            <key>description</key>
            <string>Adrian Frutiger designed Avenir in
1988, after years of having an interest in sans serif typefaces. In an interview
with Linotype, he said he felt an obligation to design a linear sans in the
tradition of Erbar and Futura, but to also make use of the experience and
stylistic developments of the twentieth century. The word Avenir means 'future'
in French and hints that the typeface owes some of its interpretation to Futura.
But unlike Futura, Avenir is not purely geometric; it has vertical strokes that
are thicker than the horizontals, an "o" that is not a perfect circle, and
shortened ascenders. These nuances aid in legibility and give Avenir a
harmonious and sensible appearance for both texts and headlines. In 2004 Adrian
Frutiger and the type director of Linotype GmbH Akira Kobayashi reworked the
Avenir and created the Avenir Next for the Platinum Collection. It includes new
small caps, newly designed true italics, and a complete new range of condensed

```

weights. Avenir Next is a versatile sans serif family, ready for large and complex projects from books to signage to advertising.</string>

        <key>description</key>
        <string>Adrian Frutiger designed Avenir in
1988, after years of having an interest in sans serif typefaces. In an interview
with Linotype, he said he felt an obligation to design a linear sans in the
tradition of Erbar and Futura, but to also make use of the experience and
stylistic developments of the twentieth century. The word Avenir means 'future'
in French and hints that the typeface owes some of its interpretation to Futura.
But unlike Futura, Avenir is not purely geometric; it has vertical strokes that
are thicker than the horizontals, an "o" that is not a perfect circle, and
shortened ascenders. These nuances aid in legibility and give Avenir a
harmonious and sensible appearance for both texts and headlines. In 2004 Adrian
Frutiger and the type director of Linotype GmbH Akira Kobayashi reworked the
Avenir and created the Avenir Next for the Platinum Collection. It includes new
small caps, newly designed true italics, and a complete new range of condensed
weights. Avenir Next is a versatile sans serif family, ready for large and
complex projects from books to signage to advertising.</string>

        <key>description</key>
        <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

        <key>description</key>
        <string>PT Serif is a universal type family
designed for use together with PT Sans released earlier. PT Serif coordinates
with PT Sans on metrics, proportions, weights and design. It consists of six
styles: regular and bold weights with corresponding italics form a standard
computer font family; two caption styles (regular and italic) are for texts of
small point sizes. The letterforms are distinguished by large x-height, modest
stroke contrast, robust wedge-like serifs, and triangular terminals. Due to
these features the face can be qualified as matched to modern trends of type
design and of enhanced legibility. Mentioned characteristics beside conventional
use in business applications and printed stuff make the fonts quite useable for
advertising and display typography.
Each font next to standard Latin and Cyrillic character sets contains alphabet
glyphs of title languages of the national republics of Russian Federation and
support the most of the languages of neighboring countries. The fonts were
developed and released by ParaType in 2010 with financial support from Federal
Agency of Print and Mass Communications of Russian Federation. Design --
Alexandra Korolkova with assistance of Olga Umpeleva and supervision of Vladimir
Yefimov.</string>

<key>description</key>
<string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
```

the STI Pub group, an informal group of publishers consisting of representatives from the American Chemical Society (ACS), American Institute of Physics (AIP), American Mathematical Society (AMS), American Physical Society (APS), Elsevier, and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter encouraged the members to consider development of a series of Web fonts, which he proposed should be called the Scientific and Technical Information eXchange, or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this proposal, and the STI Pub group agreed to embark on what has become a twelve-year project. The goal of the project was to identify all alphabetic, symbolic, and other special characters used in any facet of scientific publishing and to create a set of Unicode-based fonts that would be distributed free to every scientist, student, and other interested party worldwide. The fonts would be consistent with the emerging Unicode standard, and would permit universal representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

            <key>description</key>
            <string>Trebuchet, designed by Vincent
Connare in 1996, is a humanist sans serif designed for easy screen readability.
Trebuchet takes its inspiration from the sans serifs of the 1930s which had
large x heights and round features intended to promote readability on signs. The
typeface name is credited to a puzzle heard at Microsoft, where the question was
asked, "could you build a Trebuchet (a form of medieval catapult) to launch a
person from the main campus to the consumer campus, and how?" The Trebuchet
fonts are intended to be the vehicle that fires your messages across the
Internet. "Launch your message with a Trebuchet page".</string>

<key>description</key>

<string>Arie de Ruiter, who in 1995 was Head of Information Technology Development at Elsevier Science, made a proposal to the STI Pub group, an informal group of publishers consisting of representatives from the American Chemical Society (ACS), American Institute of Physics (AIP), American Mathematical Society (AMS), American Physical Society (APS), Elsevier, and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter encouraged the members to consider development of a series of Web fonts, which he proposed should be called the Scientific and Technical Information eXchange, or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this proposal, and the STI Pub group agreed to embark on what has become a twelve-year project. The goal of the project was to identify all alphabetic, symbolic, and other special characters used in any facet of scientific publishing and to create a set of Unicode-based fonts that would be distributed free to every scientist, student, and other interested party worldwide. The fonts would be consistent with the emerging Unicode standard, and would permit universal representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

        <key>description</key>
        <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

        <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>

        <key>description</key>
        <string>Monotype Drawing Office 1982. A
contemporary sans serif design, Arial contains more humanist characteristics
than many of its predecessors and as such is more in tune with the mood of the
last decades of the twentieth century. The overall treatment of curves is softer
and fuller than in most industrial-style sans serif faces. Terminal strokes are
cut on the diagonal which helps to give the face a less mechanical appearance.
Arial is an extremely versatile family of typefaces which can be used with equal
success for text setting in reports, presentations, magazines etc, and for
display use in newspapers, advertising and promotions.</string>

            <string>Today's digital font technology has
allowed renowned type designer Hermann Zapf to realise a dream he first had more
than fifty years ago: to create a fully calligraphic typeface.</string>

<key>description</key>

<string>Arie de Ruiter, who in 1995 was Head of Information Technology Development at Elsevier Science, made a proposal to the STI Pub group, an informal group of publishers consisting of representatives from the American Chemical Society (ACS), American Institute of Physics (AIP), American Mathematical Society (AMS), American Physical Society (APS), Elsevier, and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter encouraged the members to consider development of a series of Web fonts, which he proposed should be called the Scientific and Technical Information eXchange, or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this proposal, and the STI Pub group agreed to embark on what has become a twelve-year project. The goal of the project was to identify all alphabetic, symbolic, and other special characters used in any facet of scientific publishing and to create a set of Unicode-based fonts that would be distributed free to every scientist, student, and other interested party worldwide. The fonts would be consistent with the emerging Unicode standard, and would permit universal representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

          <key>description</key>
          <string>Adrian Frutiger designed Avenir in
1988, after years of having an interest in sans serif typefaces. In an interview
with Linotype, he said he felt an obligation to design a linear sans in the
tradition of Erbar and Futura, but to also make use of the experience and
stylistic developments of the twentieth century. The word Avenir means 'future'
in French and hints that the typeface owes some of its interpretation to Futura.
But unlike Futura, Avenir is not purely geometric; it has vertical strokes that
are thicker than the horizontals, an "o" that is not a perfect circle, and
shortened ascenders. These nuances aid in legibility and give Avenir a
harmonious and sensible appearance for both texts and headlines. In 2004 Adrian
Frutiger and the type director of Linotype GmbH Akira Kobayashi reworked the
Avenir and created the Avenir Next Condensed for the Platinum Collection. It
includes new small caps, newly designed true italics, and a complete new range
of condensed weights. Avenir Next Condensed is a versatile sans serif family,
ready for large and complex projects from books to signage to
advertising.</string>

tradition of Erbar and Futura, but to also make use of the experience and
stylistic developments of the twentieth century. The word Avenir means 'future'
in French and hints that the typeface owes some of its interpretation to Futura.
But unlike Futura, Avenir is not purely geometric; it has vertical strokes that
are thicker than the horizontals, an "o" that is not a perfect circle, and
shortened ascenders. These nuances aid in legibility and give Avenir a
harmonious and sensible appearance for both texts and headlines. In 2004 Adrian
Frutiger and the type director of Linotype GmbH Akira Kobayashi reworked the
Avenir and created the Avenir Next Condensed for the Platinum Collection. It
includes new small caps, newly designed true italics, and a complete new range
of condensed weights. Avenir Next Condensed is a versatile sans serif family,
ready for large and complex projects from books to signage to
advertising.</string>

    <key>description</key>
    <string>PT Sans is a type family of
universal use. It consists of 8 styles: regular and bold weights with
corresponding italics form a standard computer font family; two narrow styles
(regular and bold) are intended for documents that require tight set; two
caption styles (regular and bold) are for texts of small point sizes. The design
combines traditional conservative appearance with modern trends of humanistic
sans serif and characterized by enhanced legibility. These features beside
conventional use in business applications and printed stuff made the fonts quite
useable for direction and guide signs, schemes, screens of information kiosks
and other objects of urban visual communications.

The fonts next to standard Latin and Cyrillic character sets contain signs of
title languages of the national republics of Russian Federation and support the
most of the languages of neighboring countries. The fonts were developed and
released by ParaType in 2009 with financial support from Federal Agency of Print
and Mass Communications of Russian Federation. Design - Alexandra Korolkova with
assistance of Olga Umpeleva and supervision of Vladimir Yefimov.</string>

            <key>description</key>
            <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal

```

representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

<key>description</key>

<string>Paul Renner (1878-1956) was a painter, typographer, typeface designer and teacher. Between 1908 and 1917 he designed thousands of books for Munich publishers in a refined traditional style. In the early 1920s he began to support the modern styles of architecture and typography, becoming a leading proponent of the New Typography. Renner is best known for designing the typeface Futura, which became a standard tool for the New Typography, and remains a popular typeface today. Futura does give a

restful, almost bland impression, which accords with Renner's objectives. Futura seems classical, not only due to the form of its capitals, but also to the open, wide forms of the geometrical small letters. The typeface relies on notions of classical, yet contemporary form, - harmony and evenness of texture. Thanks to the modern digital technology Futura lives on in a greater variety than ever, offering a wide choice of typographic solutions for contemporary design in the new millennium.</string>

<key>description</key>

<string>Paul Renner (1878-1956) was a painter, typographer, typeface designer and teacher. Between 1908 and 1917 he designed thousands of books for Munich publishers in a refined traditional style. In the early 1920s he began to support the modern styles of architecture and typography, becoming a leading proponent of the New Typography. Renner is best known for designing the typeface Futura, which became a standard tool for the New Typography, and remains a popular typeface today. Futura does give a restful, almost bland impression, which accords with Renner's objectives. Futura seems classical, not only due to the form of its capitals, but also to the open, wide forms of the geometrical small letters. The typeface relies on notions of classical, yet contemporary form, - harmony and evenness of texture. Thanks to the modern digital technology Futura lives on in a greater variety than ever, offering a wide choice of typographic solutions for contemporary design in the new millennium.</string>

<key>description</key>

<string>Paul Renner (1878-1956) was a painter, typographer, typeface designer and teacher. Between 1908 and 1917 he designed thousands of books for Munich publishers in a refined traditional style. In the early 1920s he began to support the modern styles of architecture and typography, becoming a leading proponent of the New Typography. Renner is best known for designing the typeface Futura, which became a standard tool for the New Typography, and remains a popular typeface today. Futura does give a restful, almost bland impression, which accords with Renner's objectives. Futura seems classical, not only due to the form of its capitals, but also to the open, wide forms of the geometrical small letters. The typeface relies on notions of classical, yet contemporary form, - harmony and evenness of texture. Thanks to the modern digital technology Futura lives on in a greater variety than ever, offering a wide choice of typographic solutions for contemporary design in the new millennium. In 2016 the Visualogik Design Staff, headed by Marie-ThÃ©rÃ¨se Koreman, developed completely new character sets for greek and cyrillic, true to the Renner ideas and the early considerations of the Bauersche Giesserei, with a special eye for contemporary digital demands.</string>

<key>description</key>

<string>Arie de Ruiter, who in 1995 was Head of Information Technology Development at Elsevier Science, made a proposal to the STI Pub group, an informal group of publishers consisting of representatives from the American Chemical Society (ACS), American Institute of Physics (AIP), American Mathematical Society (AMS), American Physical Society (APS), Elsevier, and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter encouraged the members to consider development of a series of Web fonts, which he proposed should be called the Scientific and Technical Information eXchange, or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this proposal, and the STI Pub group agreed to embark on what has become a twelve-year project. The goal of the project was to identify all alphabetic, symbolic, and other special characters used in any facet of scientific publishing and to create a set of Unicode-based fonts that would be distributed free to every scientist, student, and other interested party worldwide. The fonts would be consistent with the emerging Unicode standard, and would permit universal representation of every character. With the release of the STIX fonts, de Ruiter's vision has been realized.</string>

Society, Elsevier, Inc., and The Institute of Electrical and Electronic
Engineers, Inc. Portions copyright (c) 1998-2003 by MicroPress, Inc. Portions
copyright (c) 1990 by Elsevier, Inc. All rights reserved.</string>
            <key>description</key>
            <string>Arie de Ruiter, who in 1995 was Head
of Information Technology Development at Elsevier Science, made a proposal to
the STI Pub group, an informal group of publishers consisting of representatives
from the American Chemical Society (ACS), American Institute of Physics (AIP),
American Mathematical Society (AMS), American Physical Society (APS), Elsevier,
and Institute of Electrical and Electronics Engineers (IEEE). De Ruiter
encouraged the members to consider development of a series of Web fonts, which
he proposed should be called the Scientific and Technical Information eXchange,
or STIX, Fonts. All STI Pub member organizations enthusiastically endorsed this
proposal, and the STI Pub group agreed to embark on what has become a twelve-
year project. The goal of the project was to identify all alphabetic, symbolic,
and other special characters used in any facet of scientific publishing and to
create a set of Unicode-based fonts that would be distributed free to every
scientist, student, and other interested party worldwide. The fonts would be
consistent with the emerging Unicode standard, and would permit universal
representation of every character. With the release of the STIX fonts, de
Ruiter's vision has been realized.</string>
